

BANK OF CANADA
BANQUE DU CANADA

Monetary Policy Report

April 2012

Canada's Inflation-Control Strategy¹

Inflation targeting and the economy

- The Bank's mandate is to conduct monetary policy to promote the economic and financial well-being of Canadians.
- Canada's experience with inflation targeting since 1991 has shown that the best way to foster confidence in the value of money and to contribute to sustained economic growth, employment gains and improved living standards is by keeping inflation low, stable and predictable.
- In 2011, the Government and the Bank of Canada renewed Canada's inflation-control target for a further five-year period, ending 31 December 2016. The target, as measured by the total consumer price index (CPI), remains at the 2 per cent midpoint of the control range of 1 to 3 per cent.

The monetary policy instrument

- The Bank carries out monetary policy through changes in the target overnight rate of interest.² These changes are transmitted to the economy through their influence on market interest rates, domestic asset prices and the exchange rate, which affect total demand for Canadian goods and services. The balance between this demand and the economy's production capacity is, over time, the primary determinant of inflation pressures in the economy.
- Monetary policy actions take time—usually from six to eight quarters—to work their way through the economy and have their full effect on inflation. For this reason, monetary policy must be forward looking.
- Consistent with its commitment to clear, transparent communications, the Bank regularly reports its perspective on the forces at work on the economy and their

implications for inflation. The *Monetary Policy Report* (MPR) is a key element of this approach. Policy decisions are typically announced on eight pre-set days during the year, and full updates of the Bank's outlook, including risks to the projection, are published four times per year in the MPR.

Inflation targeting is *symmetric* and *flexible*

- Canada's inflation-targeting approach is *symmetric*, which means that the Bank is equally concerned about inflation rising above or falling below the 2 per cent target.
- Canada's inflation-targeting framework is *flexible*. Typically, the Bank seeks to return inflation to target over a horizon of six to eight quarters. However, the most appropriate horizon for returning inflation to target will vary depending on the nature and persistence of the shocks buffeting the economy.

Monitoring inflation

- In the short run, a good deal of movement in the CPI is caused by fluctuations in the prices of certain volatile components (e.g., fruit and gasoline) and by changes in indirect taxes. For this reason, the Bank also monitors a set of "core" inflation measures, most importantly the CPIX, which strips out eight of the most volatile CPI components and the effect of indirect taxes on the remaining components. These "core" measures allow the Bank to "look through" temporary price movements and focus on the underlying trend of inflation. In this sense, core inflation is monitored as an *operational guide* to help the Bank achieve the total CPI inflation target. It is not a replacement for it.

¹ See *Joint Statement of the Government of Canada and the Bank of Canada on the Renewal of the Inflation-Control Target* (8 November 2011) and *Renewal of the Inflation-Control Target: Background Information—November 2011*, which are both available on the Bank's website.

² When interest rates are at the zero lower bound, additional monetary easing to achieve the inflation target can be provided through three unconventional instruments: (i) a *conditional* statement on the future path of the policy rate; (ii) quantitative easing; and (iii) credit easing. These instruments and the principles guiding their use are described in the Annex to the April 2009 *Monetary Policy Report*.

The *Monetary Policy Report* is available on the Bank of Canada's website at bankofcanada.ca.

BANK OF CANADA
BANQUE DU CANADA

Monetary Policy Report

April 2012

This is a report of the Governing Council of the Bank of Canada:
Mark Carney, Tiff Macklem, John Murray, Timothy Lane, Jean Boivin and Agathe Côté.

This report includes data received up to 13 April 2012.

The Bank will take whatever action is appropriate to achieve the 2 per cent CPI inflation target over the medium term. This is our contribution to ensuring that Canadians can save and invest with confidence.

Over the next few years, Canadian businesses will also have to analyse and act. Their decisions to refocus, retool and retrain will do much to determine how rapidly our prosperity grows in the decades ahead.

—Mark Carney

Overview

The profile for global economic growth has improved since January. Europe is expected to emerge slowly from recession in the second half of 2012, although the risks around this outlook remain high. The profile for U.S. growth is slightly stronger, reflecting the balance of somewhat improved labour markets, financial conditions and confidence on the one hand, and emerging fiscal consolidation and ongoing household deleveraging on the other. Economic activity in emerging-market economies is expected to moderate to a still-robust pace over the projection horizon, supported by an easing of macroeconomic policies. Improved global economic prospects, supply disruptions and geopolitical risks have kept commodity prices elevated. In particular, the international price of oil has risen further and is now considerably higher than that received by Canadian producers. If sustained, these oil price developments could dampen the improvement in economic momentum.

Overall, economic momentum in Canada is slightly firmer than the Bank had expected in January. The external headwinds facing Canada have abated somewhat, with the U.S. recovery more resilient and financial conditions more supportive than previously anticipated. As a result, business and household confidence are improving faster than forecast in January. The Bank projects that private domestic demand will account for almost all of Canada's economic growth over the projection horizon. Household spending is expected to remain high relative to GDP as households add to their debt burden, which remains the biggest domestic risk. Business investment is projected to remain robust, reflecting solid balance sheets, very favourable credit conditions, continuing strong terms of trade and heightened competitive pressures. The contribution of government spending to growth is expected to be quite modest over the projection horizon, in line with recent federal and provincial budgets. The recovery in net exports is likely to remain weak in light of modest external demand and ongoing competitiveness challenges, including the persistent strength of the Canadian dollar.

The Bank projects that the economy will grow by 2.4 per cent in both 2012 and 2013 before moderating to 2.2 per cent in 2014. The degree of economic slack has been somewhat smaller than the Bank had anticipated in January, and the economy is now expected to return to full capacity in the first half of 2013.

As a result of this reduced slack and higher gasoline prices, the profile for inflation is expected to be somewhat firmer than anticipated in January. After moderating this quarter, total CPI inflation is expected, along with core inflation, to be around 2 per cent over the balance of the projection horizon as the economy reaches its production potential, the growth of labour compensation remains moderate and inflation expectations stay well anchored.

Despite recent improvements to the outlook for the global and Canadian economies, risks remain elevated.

The three main upside risks to inflation in Canada relate to the possibility of higher-than-expected oil prices, stronger-than-expected growth in the U.S. economy and stronger momentum in Canadian household spending.

The two main downside risks to inflation in Canada relate to a reintensification of sovereign debt and banking concerns in Europe, and the possibility that growth in Canadian household spending could be weaker than projected.

Overall, the Bank judges that the risks to the inflation outlook in Canada are roughly balanced over the projection period.

Reflecting all of these factors, on 17 April, the Bank maintained the target for the overnight rate at 1 per cent. In light of the reduced slack in the economy and firmer underlying inflation, some modest withdrawal of the present considerable monetary policy stimulus may become appropriate, consistent with achieving the 2 per cent inflation target over the medium term. The timing and degree of any such withdrawal will be weighed carefully against domestic and global economic developments.

Global Economy

Recent developments point to a somewhat stronger profile for global economic growth than was expected at the time of the last *Report* (Table 1). The heightened uncertainty around the global outlook has eased from very high levels, but volatility can be expected to persist. Economic conditions in the United States have improved, and policy initiatives to address the sovereign debt and banking crisis in the euro area have resulted in some improvement in European debt markets and global financial conditions.

◀ *Recent developments point to a somewhat stronger profile for global economic growth*

Table 1: Projection for global economic growth

	Share of real global GDP ^a (per cent)	Projected growth (per cent) ^b			
		2011	2012	2013	2014
United States	20	1.7 (1.8)	2.3 (2.0)	2.5 (2.2)	3.6
Euro area	15	1.5 (1.5)	-0.6 (-1.0)	0.8 (0.9)	1.4

b. Numbers in parentheses are projections used for the January 2012 *Monetary Policy Report*.

Source: Bank of Canada

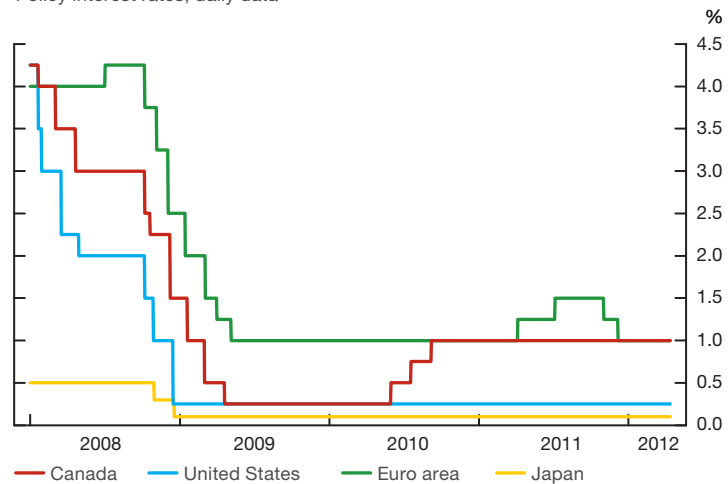

The global economy continues to face significant challenges, however. Overall, global economic growth is projected to moderate in 2012 to 3.2 per cent and to recover to 3.4 per cent in 2013 and 3.8 per cent in 2014.¹ Despite the positive impact of recent policy initiatives, the euro area is still expected to experience a recession lasting until the third quarter of 2012, followed by a sluggish recovery, with fiscal austerity, bank deleveraging and weak confidence continuing to weigh on growth. The U.S. economic expansion is projected to continue at a moderate pace through 2014, owing to the restraining effects of household deleveraging, fiscal consolidation and continuing negative spillover effects from the European crisis. Economic activity in emerging-market economies is expected to moderate over the projection horizon, albeit to a still-robust pace, supported by some easing in macro-economic policies. Improved prospects for global economic growth and supply-side disruptions have kept global commodity prices elevated, particularly for crude oil, where prices also incorporate a geopolitical risk premium related to tensions in the Middle East. This is expected to have a slight dampening effect on global economic momentum.

◀ *The global economy continues to face significant challenges, however*

¹ As is customary in the April issue of the *Monetary Policy Report*, the projection horizon has been extended by one year, in this case, to 2014.

Chart 1: Central banks in advanced economies have maintained policy interest rates at historically low levels

Policy interest rates, daily data

Note: On 5 October 2010, the Bank of Japan changed the target for its policy rate from 0.1 per cent to a range of 0.0 to 0.1 per cent. The U.S. Federal Reserve has been maintaining a target range for its policy rate of 0.0 to 0.25 per cent since 16 December 2008.

Sources: Bank of Canada, U.S. Federal Reserve, European Central Bank and Bank of Japan

Last observation: 13 April 2012

In response to modest underlying inflation pressures, central banks in advanced economies have maintained policy rates at historically low levels (Chart 1), and a few have engaged in further quantitative easing. Central banks in a number of emerging-market economies have continued to reverse past policy tightening in light of slowing prospects for domestic economic growth.

Global Financial Conditions

Conditions in global financial markets have improved, on balance

Conditions in global financial markets have improved, on balance, since the release of the *January Report*. The measures taken in Europe to address the sovereign debt and bank funding crisis, as well as stronger growth prospects in the United States, have led to an improvement in market sentiment over this period. The tone in markets was also boosted by the U.S. stress tests, which showed that the largest U.S. banks would retain sufficient capital to withstand an extremely adverse macroeconomic scenario. More recently, however, concerns about the sovereign debt positions of some euro-area peripheral economies, especially Spain, have reintensified, and investor confidence has diminished somewhat.

European policy-makers have taken a number of initiatives over the past year to improve financial stability and confidence. They have agreed on a second financial program for Greece in conjunction with substantial private sector debt relief, raised the requirement for core Tier 1 capital ratios for banks, adopted a new Fiscal Compact and increased the financial backstop for euro-area members from €500 billion to €700 billion.² In addition, the European Central Bank (ECB) has provided approximately €1 trillion in liquidity to banks in the region through two longer-term refinancing

² The combined lending capacity of the European Financial Stability Facility and the European Stability Mechanism (ESM) is €700 billion, of which €500 billion represents the permanent lending capacity of the ESM. The remaining €200 billion consists of existing commitments to Greece, Ireland and Portugal.

Last observation: 13 April 2012

operations and loosened collateral requirements.³ As a result, funding conditions for European financial institutions have improved (Chart 2). With the exception of Spain, yields on euro-area government bonds have fallen, with sovereign spreads over German bonds declining (Chart 3). Taken together, these developments suggest that the near-term risk of a severe bank liquidity crisis in the euro area has decreased.

Government bond yields in most major advanced economies have fluctuated noticeably since the release of the *January Report*. Following an initial rise in reaction to improved prospects for global economic growth, yields

³ The longer-term refinancing operations were conducted in December 2011 and February 2012. The net liquidity injection amounted to around €500 billion after taking into account the existing borrowing from the European Central Bank that was rolled out of short-term operations such as the main refinancing operations with a maturity of one week.

Chart 5: Corporate bond issuance has recovered strongly since the beginning of the year

Global corporate issuance placed in U.S. dollars, monthly data

Source: Bloomberg

Last observation: March 2012

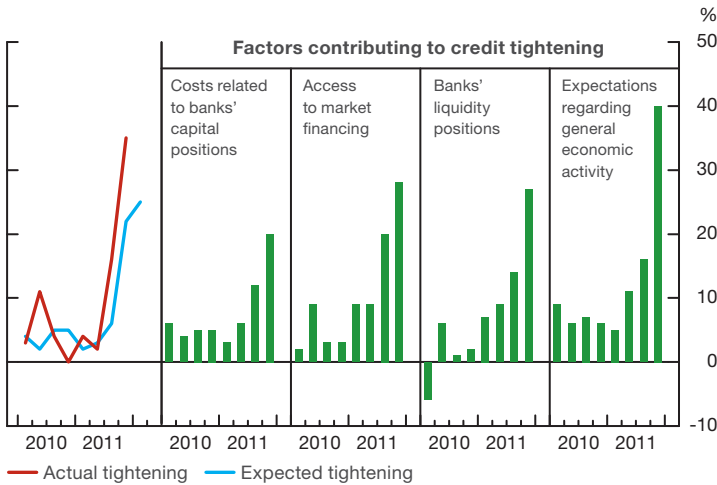

Corporate bond issuance has recovered strongly

have reversed most of their gains, owing to the deterioration in market sentiment in the past few weeks (Chart 4). In particular, German bond yields have fallen to record lows. Equity prices have fallen modestly in Europe since the last Report, reflecting renewed concerns over the debt situation, but have improved in most other economies. Global corporate bond spreads have narrowed, particularly for financial and high-yield issuers, and yields on U.S. investment-grade corporate bonds recently touched all-time lows. In this shifting environment, corporate bond issuance has recovered strongly since the beginning of the year, with both financial and non-financial firms taking advantage of better access to primary markets (Chart 5).

Despite the generally improved tone in financial markets since January, banks in the euro area have continued to tighten borrowing conditions for households and firms (Chart 6). Developments in Europe have also had

Chart 6: Banks in the euro area have continued to tighten borrowing conditions since the last Report

Net percentages of banks contributing to credit tightening for enterprises

Note: Data reflect responses to the euro-area Bank Lending Survey. "Actual tightening" refers to the tightening that has already occurred, while "expected tightening" refers to the additional tightening anticipated by banks.

Source: European Central Bank

Last observation: 2011Q4

an impact on bank lending conditions in the United States. Foreign banks operating in the United States have tightened approval standards on loans to U.S. corporations, while both U.S. and foreign banks tightened conditions on loans to banks headquartered in Europe and to non-financial firms with significant exposures to European economies.

While the ECB's expanded liquidity operations have not by themselves directly improved the underlying health of bank balance sheets, they have created space for the restructuring of these balance sheets to proceed at an orderly pace. Pressures on funding conditions from bank deleveraging in the euro area are thus expected to persist, but to be less intense than anticipated at the time of the January Report.

Euro Area

The euro area entered a recession in the fourth quarter of 2011, with real GDP contracting by 1.2 per cent, as expected. However, recent economic conditions have improved slightly. Business and consumer confidence have recovered modestly, and purchasing managers' indexes suggest that the pace of output contraction is likely to ease somewhat in the first half of 2012.

The divergences in economic conditions between the core and peripheral euro-area economies are striking. The unemployment rate in Germany remains close to post-unification record lows, while unemployment rates in Spain, Portugal and Greece are at record highs (Chart 7). Indicators such as unit labour costs suggest that the peripheral economies have made limited progress in narrowing their competitiveness gap with the core economies. In light of continued economic weakness, some peripheral economies face considerable challenges in implementing the extensive fiscal adjustments and deep structural reforms required to restore competitiveness and ensure sustainable fiscal positions.

◀ The euro area entered a recession in the fourth quarter of 2011, which is projected to continue through the third quarter of 2012

Chart 7: Striking divergences are apparent between the unemployment rates of core and peripheral economies in the euro area

Unemployment rates, monthly data

Source: Eurostat

Last observations: January and February 2012

The euro area is projected to be in recession through the third quarter of 2012 as fiscal consolidation, bank deleveraging, tight financial conditions and negative confidence effects lead to a significant drop in domestic demand. A modest recovery in economic activity is projected to begin in the second half of 2012, supported by a pickup in export growth in response to a gradual strengthening in external demand. Domestic demand is projected to grow modestly beginning in 2013, boosted by a gradual easing in financial conditions and an improvement in confidence. Relative to the January *Report*, the ongoing recession is expected to be somewhat shallower, owing to smaller-than-anticipated negative effects from both bank deleveraging and weak confidence levels. Growth prospects over the remainder of the projection horizon, however, are similar to expectations in January.

Increases in commodity prices and a rise in indirect taxes and administered prices from fiscal consolidation brought total inflation in the euro area to 2.6 per cent in March. Inflation pressures are expected to moderate over the projection horizon, however, in response to considerable excess capacity.

United States

U.S. consumer and business confidence have shown more resilience than expected

U.S. real GDP grew by close to 2.5 per cent in the second half of 2011, from less than 1 per cent over the first half of the year, and recent economic developments have been largely positive. On average, monthly employment gains have strengthened since the fourth quarter of 2011, and consumer and business confidence have shown more resilience than expected. The assessment of the fundamentals for household spending is now stronger, owing to upward revisions to personal income over the second half of 2011, while the recent increase in equity prices has boosted household net worth. The spillover effects of the euro-area crisis on U.S. financial conditions and confidence are likely to be smaller than expected. As a result, the profile for U.S. economic growth is stronger over the projection horizon than was anticipated in the last *Report*, despite the negative effects of higher oil prices.

Chart 8: U.S. real GDP growth is projected to remain relatively modest compared with previous U.S. recoveries

U.S. real GDP across economic cycles; start of recession = 100, quarterly data

Note: The Big Five modern financial crises, as described in Reinhart and Rogoff (2008), are Spain (1977), Norway (1987), Finland (1991), Sweden (1991) and Japan (1992). See C.M. Reinhart and K.S. Rogoff, "Is the 2007 U.S. Sub-Prime Financial Crisis So Different? An International Historical Comparison," *American Economic Review: Papers and Proceedings* 98, no. 2 (2008): 339–44.

Sources: U.S. Bureau of Economic Analysis, Organisation for Economic Co-operation and Development, and Bank of Canada projections

Notwithstanding this stronger outlook, U.S. real GDP is projected to grow at a relatively modest pace through the first half of 2013, dampened by fiscal consolidation and continued household deleveraging (Chart 8). Economic activity is expected to strengthen more noticeably thereafter as the impact of these factors dissipates. On balance, growth in real GDP is projected to rise from 2.3 per cent in 2012, to 2.5 per cent in 2013 and 3.6 per cent in 2014.

Monetary conditions are expected to remain very accommodative: the U.S. Federal Reserve recently extended, through to at least late 2014, its guidance regarding the period during which economic conditions are likely to warrant exceptionally low levels of the federal funds rate.⁴ In contrast, fiscal consolidation is expected to exert a significant drag on U.S. economic growth, amounting to roughly 1 percentage point in 2012, 2.5 percentage points in 2013 and one-half percentage point in 2014, similar to expectations at the time of the *January Report* (Chart 9). This projected fiscal drag includes the winding down of stimulus programs introduced during the recession, the expiration of payroll tax reductions at the end of 2012 and sequestration cuts starting in 2013. The projected increase in U.S. real GDP growth between 2013 and 2014 is highly contingent on the expected profile for fiscal policy.⁵

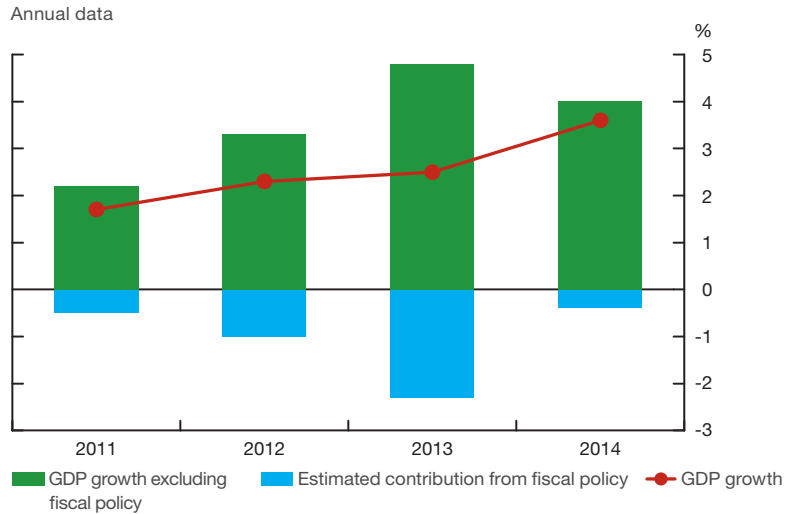

◀ U.S. real GDP is projected to grow at a relatively modest pace

◀ Fiscal consolidation is expected to exert a significant drag on U.S. economic growth

⁴ The U.S. Federal Reserve has also adopted an explicit inflation target of 2 per cent, as measured by the annual change in the price index for personal consumption expenditures.

⁵ Policy-makers in the United States could decide to adopt policies that would reduce the projected size of the fiscal drag in 2013. This could be achieved by postponing some or most of the sequestration cuts that are currently expected to take place during that year. The stronger economic growth in 2013 that would result from these actions could be at the expense of growth in 2014, however (depending on the revised timing of the cuts).

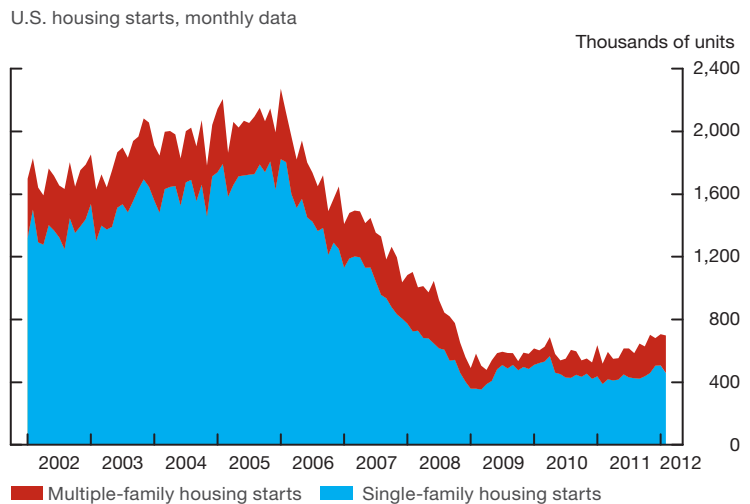

Chart 9: Fiscal consolidation is expected to exert a significant drag on U.S. real GDP growth

Note: The contribution of fiscal policy to growth includes both direct government expenditures and the indirect effects on other components of aggregate demand. The estimated contribution over history has been reassessed in light of additional information on U.S. government spending.

Sources: U.S. Bureau of Economic Analysis and Bank of Canada calculations and projections

Chart 10: U.S. housing starts remain at a low level

Source: U.S. Census Bureau

Last observation: February 2012

The recovery in consumption spending is projected to remain quite modest by historical standards as households rebuild their balance sheets in an environment of persistently weak housing prices, fiscal consolidation, modest gains in employment and elevated oil prices.

Residential investment remains very weak ▶

Residential investment remains very weak. Recent growth partly reflects an increase in the construction of apartment buildings, as high unemployment and tight mortgage credit conditions have led to a shift in demand away from home ownership toward renting (Chart 10). The inventory of vacant houses and the pending supply of foreclosures remain near recent record-high levels and are restricting the construction of new homes, as well as putting downward pressure on house prices. High vacancy rates and tight credit conditions have also been restraining the growth of non-residential construction. Both residential and non-residential construction are projected to remain

at low levels, although some gradual improvement is expected over the projection horizon, supported by the reduction in the overhang of unsold houses, a gradual easing in borrowing conditions and a stronger economy.

Exports and business investment in equipment and software are expected to provide important support to U.S. economic growth over the projection horizon. Notwithstanding the dampening effects from low rates of resource utilization, business investment is projected to grow at a healthy pace through 2014, supported by solid corporate balance sheets, strong earnings and the low cost of capital. Although the growth of exports is expected to slow somewhat in 2012, owing to the recent appreciation of the U.S. dollar and a deceleration in foreign demand, it should rebound over 2013–14 as global demand recovers.

Given the modest pace of U.S. economic growth, excess supply conditions are expected to recede only gradually over the projection horizon. As a result, underlying inflation pressures are projected to remain subdued.

◀ *Exports and business investment are expected to provide important support to U.S. economic growth*

Japan

In Japan, real GDP fell by 0.7 per cent in the fourth quarter of 2011 as supply-chain disruptions from the flooding in Thailand, as well as the high level of the yen and faltering external demand, caused a sharp decline in exports. With rapid restoration of these supply chains, indicators suggest that growth in Japan resumed at a modestly positive pace in the first quarter of 2012. Over the projection horizon, real GDP growth is projected to average around 1.7 per cent per year, supported by the continued rebuilding of infrastructure. Although exports are expected to grow only modestly in 2012, they are projected to gather momentum beginning in 2013, as global demand rebounds. With inflation well below the recently announced goal of 1 per cent, the Bank of Japan decided to increase the size of its Asset Purchase Program by ¥10 trillion, or about 2 per cent of GDP, through government bond purchases.

Emerging-Market Economies

Real GDP growth in China in the first quarter moderated to 8.1 per cent on a year-over-year basis, as a result of lower external demand and the effects of previous tightening in monetary and macroprudential policies. Activity in the housing sector has slowed, causing house prices to retreat from the recent peak reached in August 2011 (**Chart 11**). Growth in exports has decelerated more abruptly, in response to weaker demand from Europe, which accounts for around one-fifth of Chinese exports (**Chart 12**). Consumer price inflation in China stood at 3.6 per cent in March 2012, well below its recent peak of 6.5 per cent in July 2011, owing in large part to rapidly moderating food price inflation. With inflation pressures easing, monetary policy is becoming more accommodative. Chinese authorities have reduced the reserve requirement ratio by 100 basis points since December, and further easing is expected.

Growth in China's real GDP is projected to average approximately 8 per cent per year through 2014, similar to expectations at the time of the *January Report*. A modest appreciation of China's real exchange rate and the government's announced plan to boost household spending are expected to support a gradual rotation of demand away from exports and investment and toward consumption. Nevertheless, global imbalances remain a concern and are projected to stay elevated over the projection horizon.

Last observations: February and March 2012

Economic growth in other emerging markets is expected to gain momentum over 2013–14

Real GDP growth in other emerging-market economies is also projected to decelerate in 2012, driven primarily by slowing external demand, past policy tightening and pressures on financial conditions from international bank deleveraging in some countries. However, economic growth is expected to gain momentum over 2013–14, as the growth of exports to advanced economies recovers. Growth prospects for these economies have been revised upward relative to the January *Report*, owing to stronger foreign demand, somewhat easier financial conditions and higher commodity prices, which benefit many commodity producers in this group.

Global commodity prices have generally stayed at elevated levels

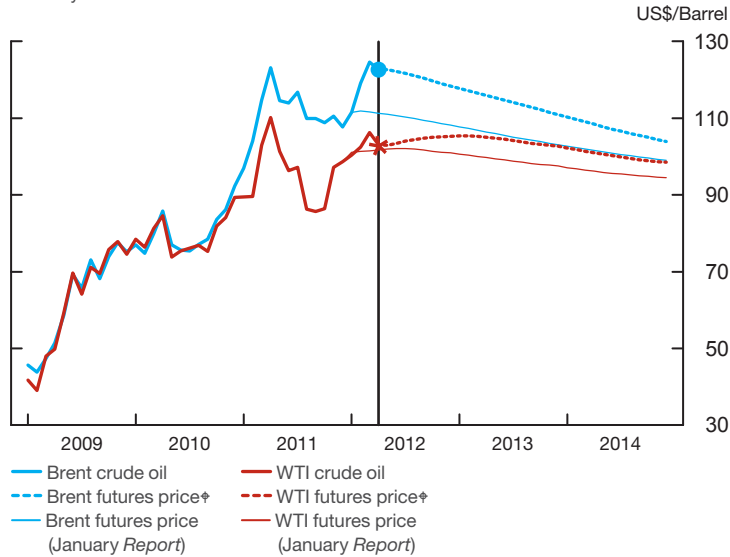

Commodity Prices

Global commodity prices have generally stayed at elevated levels, but have moved in somewhat different directions over the past few months. Heightened geopolitical tensions in the Middle East, together with supply disruptions in some jurisdictions and an improvement in the outlook for global economic

Chart 13: Oil prices are expected to stay at elevated levels

Monthly data

* Spot price for WTI crude oil (13 April 2012)
 ● Front-month futures for Brent crude oil (13 April 2012)
 † Based on an average of futures contracts over the two weeks ending 13 April 2012
 Note: Values for crude oil prices in April 2012 are estimates based on the average daily spot prices up to 13 April 2012. For Brent crude oil prices, front-month futures prices are used.
 Source: Bank of Canada

activity, have combined to push Brent crude oil prices above the levels anticipated at the time of the *January Report*. Prices for West Texas Intermediate (WTI) crude oil, in contrast, are little changed compared with their levels at the time of the *January Report*, owing to abundant supply conditions in the U.S. Midwest. As a result, the spread between Brent and WTI crude oil prices has widened to approximately US\$20 per barrel. Based on the latest futures curve, prices for both Brent and WTI are projected to remain firm in the near term, declining thereafter in response to the normalization of global supply conditions (Chart 13). Oil prices are projected to be higher than expected at the time of the last *Report*, consistent with a more optimistic assessment of demand prospects.

North American prices for natural gas have fallen, as cuts in production have failed to offset the impact of unseasonably warm weather. The latest futures curve suggests that natural gas prices will rise through 2014 as natural gas gains market share as an input for the generation of electricity, but prices are nevertheless projected to remain at relatively low levels, below the profile anticipated in the *January Report* (Chart 14).

Prices of non-energy commodities have increased over the past few months, supported by improved global demand, as well as supply concerns in agricultural markets. While prices for agricultural products are expected to decline over the projection horizon as supply conditions improve, prices for forestry products are projected to rise gradually, in line with a modest recovery in the U.S. housing sector. Metals prices are expected to remain at current levels until the end of 2013, before rising in 2014 owing to stronger global economic growth.

◀ *Oil prices are projected to be higher than expected at the time of the last Report*

External demand for Canada's exports remains weak

Implications for the Canadian Economy

External demand for Canada's exports remains weak. The foreign activity measure has recovered only half of the decline experienced during the last recession, owing largely to protracted weakness in the U.S. housing sector. This measure is expected to steadily expand over the projection horizon, as the composition of external demand becomes more favourable to Canadian exports, surpassing its pre-recession level in the second half of 2013. The projected profile of the activity measure is somewhat stronger than was anticipated in the *January Report*, in line with the upward revision to the U.S. economic outlook.

Higher global commodity prices typically have positive wealth and income effects on the Canadian economy through improved terms of trade. However, the Bank of Canada's commodity price index (BCPI) has declined since January (**Chart 15**), owing largely to the relatively high weight of natural gas prices in the index.⁶ Moreover, although global oil prices have risen sharply since January, the prices received by Canadian producers of crude oil have declined (**Box 1**). As a result, Canada's terms of trade have deteriorated. Going forward, the BCPI and the terms of trade are projected to rise through 2014, reflecting some recovery in natural gas prices, continued increases in non-energy commodity prices, and an expected narrowing in the spread between Canadian export and import prices for crude oil.

⁶ Large movements in the relative prices of commodities may, on occasion, cause some deviation between the BCPI and commodity prices received by Canadian producers, since the weights in the BCPI are updated with a four-year lag, as new production data from the input-output tables produced by Statistics Canada become available. For example, the sharp increase in oil prices in recent years relative to natural gas prices and the associated shift in the value of Canadian production have likely led the BCPI to understate the overall level of commodity prices in Canada. The recent unprecedented divergence between Canadian and global prices for crude oil, as detailed in **Box 1**, has likely worked in the other direction, since the BCPI uses WTI prices as a proxy for Canadian oil prices. In preparing its projection for the Canadian economy, the Bank uses the full spectrum of movements in the commodity prices that are relevant for Canada, including those not fully captured by the evolution of the BCPI. The Bank will continue to evaluate methods to improve the BCPI as a measure of commodity prices in Canada.

Box 1

Rising Oil Prices and Their Impact on the Canadian Economy

Global oil prices, as measured by the Brent benchmark, have increased by roughly 15 per cent since reaching a recent trough in October 2011. This rise, due predominantly to supply cuts and rising political tensions in the Middle East, has consequences for both global economic activity and the Canadian economy.

Not all oil prices have risen equally. North American crude oil benchmarks such as West Texas Intermediate (WTI) remain well below their global counterparts, owing to excess supply at Cushing, Oklahoma, the delivery point for WTI (Chart 1-A). In addition, the prices of Canadian crudes such as Western Canada Select (WCS) have decreased in 2012, largely because of a combination of strong supply growth and temporary refinery and pipeline outages in Canada and the U.S. Midwest, coupled with overall inadequate pipeline capacity to move crude to other areas. These oil price movements have resulted in an unprecedented spread between Brent and WCS (Chart 1-B).

The implications for the global economy of the recent rise in oil prices are modestly negative. Higher oil prices, driven primarily by supply disruptions and an elevated risk premium, contribute to inflationary pressures and dampen global economic activity. In the United States, a net oil importer that faces a mix of WTI and global oil prices, economic growth is expected to be restrained as higher oil prices lead to a reduction in real disposable income, a deterioration in the terms of trade and a rise in the cost of oil inputs.

Increases in oil prices are usually beneficial for a net exporter such as Canada. In particular, when rising oil prices are caused by an increase in world aggregate demand, the gain in Canada's real income associated with the improvement in the terms of trade, along with the greater demand for Canadian non-commodity exports, will more than offset increases in costs for businesses and households.¹

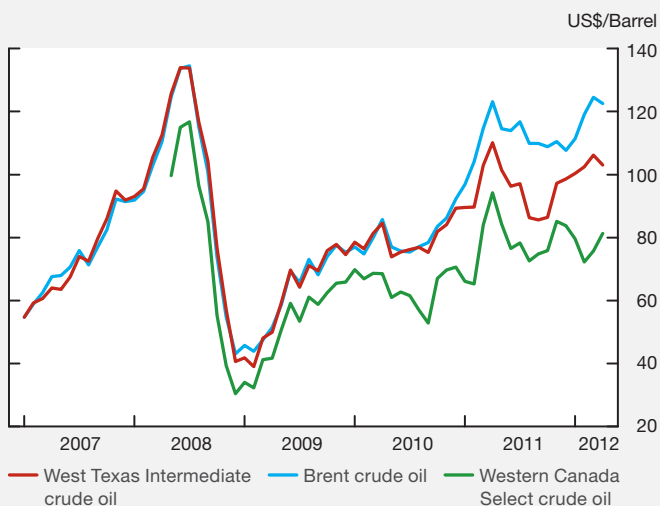

However, in the case of oil price increases resulting from supply factors, the positive effects on Canadian real income will be reduced, as lower activity in Canada's main trading partners will depress demand for Canada's non-commodity exports. The positive effects could be further reduced, or even reversed, if the price of our oil imports rises more than the price of our oil exports.

This is why the recent evolution of oil prices since January has been unfavourable for Canada. This evolution has been driven by supply factors and the fact that the price of oil that Canada imports (more closely tied to Brent)

has increased, while the price of oil that Canada exports (more closely tied to WTI and WCS) has declined. The increase in the price of our oil imports raises production

(continued...)

Box 1 (continued)

costs for Canadian firms and also puts upward pressure on gasoline prices, since about half of the gasoline purchased in Canada is produced using refined petroleum priced off Brent.² By itself, this deterioration in the oil-related terms of trade reduces Canada's real gross domestic income, since Canada's real income available to purchase foreign goods and services decreases. This reduction in real income may, in turn, dampen spending on domestically produced goods and services.

² For a detailed description of the relationship between crude oil and gasoline prices in Canada, see Technical Box 3 in the October 2011 *Monetary Policy Report*.

Increased capacity utilization at refineries that experienced temporary outages, combined with the planned reversal of the direction of flow in the Seaway Crude Pipeline System, should lead to a greater convergence between the prices of Canadian crudes and that of WTI crude in the coming months, thus helping to improve Canada's terms of trade.³ The price differential between WTI and Brent is expected to persist for some time, however, until new pipeline capacity is put in place in the United States or Canada to reduce the excess supply situation at Cushing, Oklahoma.

³ The reversal of the Seaway pipeline, which currently carries oil from the U.S. Gulf Coast to Cushing, Oklahoma, is expected to become operational in June, and to reach its full capacity in the first quarter of 2013.

Canadian Economy

The Bank expects the Canadian economy to grow at a moderate pace over the projection horizon, with total and core CPI inflation remaining close to the 2 per cent target. The Bank continues to anticipate that the economic expansion will be driven by growth in private domestic demand over the projection horizon. Net exports are expected to contribute only marginally to overall growth, reflecting the modest recovery in foreign activity and Canada's ongoing competitiveness challenges, including the persistent strength of the Canadian dollar.

◀ *The Bank expects the Canadian economy to grow at a moderate pace*

Economic momentum in Canada is slightly firmer than the Bank had expected in the *January Report*. The external headwinds facing the Canadian economy have abated somewhat, with the U.S. economic recovery showing more resilience than previously anticipated and financial conditions more supportive than expected. Furthermore, with confidence having rebounded more quickly than envisaged in January, the Bank expects that global uncertainty will have less of a dampening effect on the spending of Canadian households and businesses in coming quarters.

◀ *The external headwinds facing the Canadian economy have abated somewhat*

Financial Conditions

The aggregate supply and price of credit to businesses and households in Canada remain very stimulative (**Chart 17**), providing important ongoing support to the economic expansion.

Credit conditions for Canadian firms began to ease again in the first quarter, as reported in both the Bank's *Senior Loan Officer Survey* (available on the Bank's website under [Publications and Research > Periodicals > SLOS 2012Q1](#)) and the *Business Outlook Survey* (available on the Bank's website under [Publications and Research > Periodicals > BOS Spring 2012](#)), in the context of improved global financial conditions (**Chart 18**).

◀ *Financial markets in Canada have maintained a positive tone*

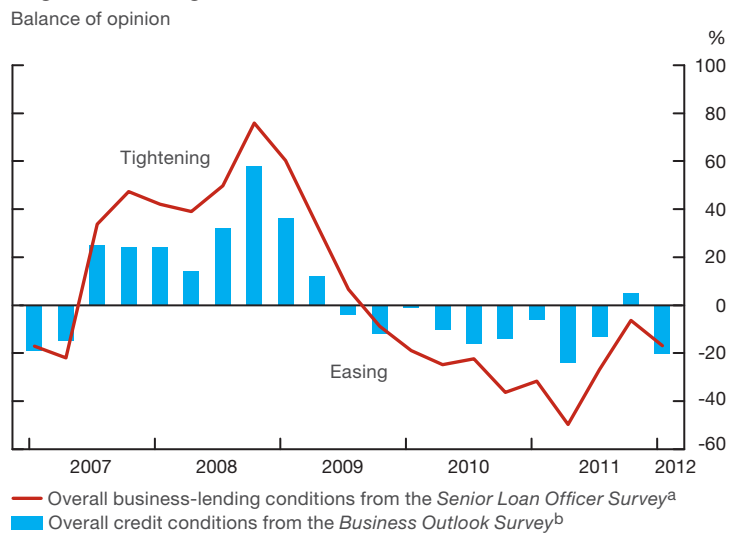

Financial markets in Canada have maintained a positive tone in recent months in the face of fluctuations in Europe. Yields on Canadian government bonds are just above the low levels seen at the time of the *January Report*, having moved generally in line with major foreign markets. Corporate yields have also remained at very low levels, and the volume of bond issuance has increased (**Chart 19**). These favourable developments are partly due to sustained international demand for the debt of Canadian governments, banks and corporations, a sign that their credit quality is perceived to be high by global standards. While the S&P/TSX Composite Index has declined slightly since the *January Report*, the prices of Canadian bank equities, which had performed better than those of other advanced economies during a period of heightened uncertainty last year, have risen further.

The growth of business credit has picked up somewhat ►

In this context, Canadian banks continue to be well positioned to lend, with ready access to relatively low-cost funding across the term structure in both Canadian and foreign currencies. The growth of business credit has picked up somewhat in recent months, consistent with some easing in credit conditions and a pickup in the growth of business investment. However, given their strong aggregate financial position, non-financial corporations continue to have a limited need for external financing.

Chart 19: Canadian bond issuance has picked up

Corporate debt issuance by domestic firms, in Canadian dollars

Source: Bank of Canada

Last observation: 2012Q1

Household credit also remains readily available at near-record low rates, owing in large part to exceptionally low long-term fixed mortgage rates. The pace of household credit growth has moderated in recent months (Chart 20), however, following a long period of comparatively rapid growth that has pushed household indebtedness to record levels relative to disposable income.

◀ Household credit also remains readily available at near-record low rates

As confidence in Canada has improved in recent months, growth in the narrow monetary aggregates has moderated, consistent with a reduced preference for liquidity. Growth in the broad monetary aggregates has also eased modestly of late, while remaining consistent with expectations of relatively subdued inflation pressures.

► The slack in the Canadian economy is now estimated to be less than previously expected

Estimated Pressures on Capacity

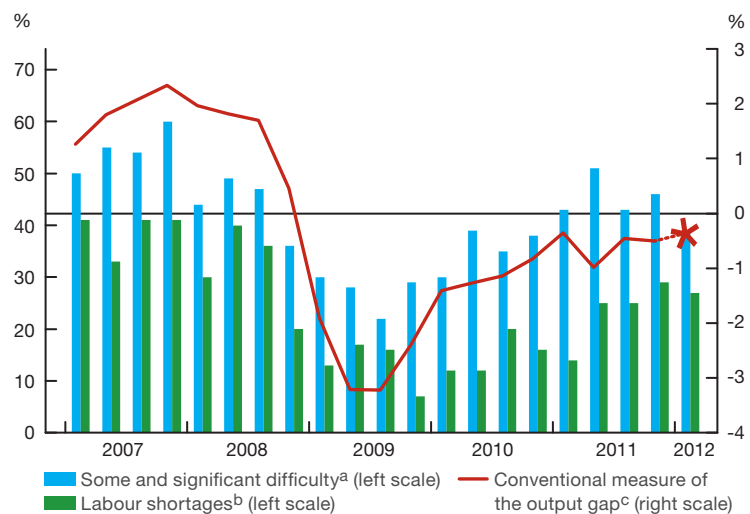

The slack in the Canadian economy is now estimated to be less than previously expected, since the level of real GDP in the first quarter of 2012 is estimated to be 0.3 per cent higher than the Bank had forecast in the *January Report*. This reflects the combination of an upward revision to reported GDP growth in the third quarter of 2011, an upwardly revised estimate of 2.5 per cent growth for the first quarter of 2012, and fourth-quarter growth of 1.8 per cent, which was broadly in line with expectations in the *January Report*. On balance, these results reflect greater momentum in household consumption and business investment in Canada, as well as stronger-than-anticipated foreign activity. The Bank's conventional measure of the output gap, at -0.4 per cent in the first quarter of 2012, also points to less slack in the economy than previously expected (Chart 21). This is consistent with responses to the Bank's *Business Outlook Survey* in recent quarters, which have shown that the proportion of firms that would have difficulty responding to an unexpected increase in demand has remained close to its historical average.

Developments in labour market indicators have been consistent with the persistence of a slightly greater degree of excess supply. Despite notable improvements in March, both employment and the unemployment rate are little changed, overall, from their levels six months ago (Chart 22). Similarly, the proportion of involuntary part-time workers has only partially recovered from its sharp rise during the recession, pointing to the persistence of unused capacity in the labour market. The proportion of firms reporting labour shortages in the Bank's spring *Business Outlook Survey* also remained below its historical average.

► The Bank judges that the economy was operating at roughly half a per cent below its production capacity in the first quarter of 2012

On balance, the Bank judges that the economy was operating at roughly half a per cent below its production capacity in the first quarter of 2012, a smaller degree of slack than had been anticipated in the *January Report*.

The Real Economy

The Bank expects a moderate pace of expansion to continue over the projection horizon (Chart 23). On an average annual basis, real GDP is forecast to grow by 2.4 per cent in both 2012 and 2013, before moderating to 2.2 per cent, the rate of the economy’s production potential, in 2014 (Table 2). Private domestic demand, supported by accommodative domestic financial conditions, is expected to account for almost all of Canada’s economic growth over the projection horizon (Chart 24).

This outlook for the Canadian economy is slightly firmer than in the January Report, with greater momentum through 2012

This outlook for the Canadian economy is slightly firmer than in the January Report, with greater momentum through 2012 than had been anticipated, although the projected pace of growth in 2013 is now somewhat more modest than previously envisaged (Table 3). The stronger quarterly profile over most of 2012 partly reflects more positive sentiment than previously assumed, in line with the stronger U.S. and global economic outlook.⁷ The profile for growth in consumption and investment is more front-loaded than previously expected, in part reflecting a more rapid improvement in confidence (Chart 25). The rise in global oil prices since the January Report is

⁷ Growth in the first half of 2012 is also being boosted by temporary factors related to the rebuilding of motor vehicle inventories, following the large drawdown that took place in the latter part of 2011 as a result of the flooding in Thailand, as well as a return to more normal production in the oil sector following disruptions at the end of 2011.

not, however, expected to provide a further boost to domestic demand through higher real incomes, since the prices received by Canadian producers have gone down, while those paid by Canadian consumers have gone up (Box 1). Nonetheless, the recent greater momentum in private domestic demand is forecast to result in a higher profile for imports than in January, offsetting the more positive contribution to economic growth of stronger foreign activity and stronger Canadian exports in this projection.

Growth in household expenditures (the combination of consumer spending and residential investment) has picked up in recent quarters, and is expected to continue at a moderate pace through 2014. The Bank continues

◀ *Growth in household expenditures has picked up in recent quarters*

The ratio of household debt to income is projected to rise further

to expect consumption to grow at a rate that is slightly below the projected moderate growth in personal disposable income (Chart 26), resulting in a slight rise in the savings rate (Box 2). Growth in residential investment, which is currently supported by very favourable mortgage-financing conditions (Chart 27), is forecast to slow over the projection horizon. Nonetheless, the ratio of household expenditures to GDP is expected to remain relatively high over the projection horizon (Chart 28). In that context, the ratio of household debt to income is projected to rise further.

Box 2

The Savings Rate, Housing Wealth and Debt

The personal savings rate in Canada was 3.4 per cent in the fourth quarter of 2011, close to its average level of the past 10 years. This is, however, a much lower rate than had been observed previously in Canada. Since 1961, the savings rate has averaged roughly 9 per cent; excluding the period of high and variable inflation from the mid-1970s through the 1980s, the savings rate has averaged roughly 6.5 per cent (**Chart 2-A**).¹

The historically low savings rates seen over the past decade have coincided with considerable financial innovation, large and persistent increases in house prices, and elevated levels of residential investment. Since 2001, the value of residential real estate in Canada has doubled to about \$3 trillion.

It is not surprising that households would seek to consume some fraction of their increase in housing wealth, either by extracting higher housing equity to spend or by consuming more out of current income because they feel wealthier; either of these would result in a lower measured personal savings rate. Empirical estimates of the total marginal propensity to consume out of housing wealth in Canada range from 6 per cent to 16 per cent over the long run, assuming that the increases in wealth are viewed as permanent.² This housing wealth effect on consumption may have increased over time, as financial innovations have made it easier to borrow against increased home equity.³

Research at the Bank confirms that the extraction of housing equity through borrowing has increased substantially over the past decade, accounting for a large share of the increase in household debt and contributing importantly to consumption.⁴ The amount of home equity extracted through home-equity lines of credit (HELOCs) and net mortgage refinancing grew from \$8 billion in 2001 to \$64 billion in 2010 (**Chart 2-B**). Surveys suggest that approximately half of this equity extraction is used either for current consumption or to pay off other debt, much of which will be higher-rate debt, itself used to finance past

consumption. Overall, it is estimated that home-equity extraction has funded roughly 3 per cent of aggregate consumer spending in Canada in recent years, up from less than 1 per cent in 2001. A simulated alternative personal savings rate, calculated by excluding consumption funded

Last observation: 2010

1 The high-inflation environment in the 1970s and 1980s importantly accounted for the elevated personal savings rates observed in that period. Nonetheless, the savings rates observed over the past decade have, on balance, been lower than in the 1960s, when inflation was similarly low and stable.
 2 See P. Catte, N. Girouard, R. Price and C. André, "The Contribution of Housing Markets to Cyclical Resilience," OECD Economic Studies No. 38, 2004, and C. Bertaut, "Equity Prices, Household Wealth and Consumption Growth in Foreign Industrial Countries," Federal Reserve Board International Discussion Papers No. 724, 2002.
 3 In principle, equity can be extracted in two ways, either through borrowing or through the sale of an asset.
 4 See J. Bailliu, K. Kartashova and C. Meh, "Household Borrowing and Spending in Canada," *Bank of Canada Review* (Winter 2011–2012): 16–29.

Box 2 (continued)

directly through HELOCs and net mortgage refinancing, has averaged close to 5 per cent over the past decade, nearer to the level observed through the second half of the 1990s (Chart 2-C).^{5,6}

Home equity extracted through additional borrowing cannot fund higher consumption indefinitely. Once the proportion of homeowners that access higher housing wealth through HELOCs reaches its peak, the personal savings rate can be expected to rise. This implies a lower level of consumption relative to income. With less equity in their homes, households would also be more exposed to a decline in house prices, which could further dampen consumption.

- 5 See A. Greenspan and J. Kennedy, "Sources and Uses of Equity Extracted from Homes," Finance and Economics Discussion Series 2007-20, 2007, for a similar analysis of the potential effects of home-equity extraction on the savings rate in the United States.
- 6 This analysis abstracts from potential endogenous responses of households and financial institutions.

Chart 28: The share of household expenditures in GDP is expected to remain elevated

Quarterly data

Sources: Statistics Canada and Bank of Canada calculations and projections

The Bank continues to expect robust growth in business fixed investment

The Bank continues to expect robust growth in business fixed investment over the projection horizon, reflecting the strong financial positions of Canadian firms, favourable credit conditions, high commodity prices and the strong Canadian dollar, as well as the impetus to improve productivity amid heightened pressures to become more competitive. This robust outlook for growth in investment broadly maintains the share of investment in GDP around its historical average (Chart 29). The projected profile for business fixed investment has been revised up from the *January Report*, particularly for 2012, reflecting a stronger and less uncertain global economic

Chart 29: Investment as a share of GDP is expected to remain near historical averages

Sources: Statistics Canada and Bank of Canada calculations and projections

outlook. This forecast is consistent with Statistics Canada’s survey on private and public investment intentions, which points to strong growth in 2012 led by the oil and gas sector, and with the Bank’s spring *Business Outlook Survey*, which indicates that investment intentions over the next 12 months remain strongly positive.

The contribution of government spending to real GDP growth is expected to be quite modest over the projection horizon, in line with the fiscal plans of federal and provincial governments to consolidate spending, as outlined in recent budget statements. In this regard, significant downward revisions to National Accounts estimates of government spending in recent quarters suggest that the unwinding of the temporary fiscal stimulus measures implemented during the recession was largely completed by the end of 2011. In light of these developments, the Bank assumes a somewhat lower overall profile for government expenditures over the projection horizon than in the *January Report*.

The recovery in net exports is expected to remain weak. With low levels of U.S. demand for autos and housing, coupled with ongoing competitiveness challenges, Canada’s exports are not forecast to regain their pre-recession peak until the end of 2013 (**Chart 30**). In contrast, the level of imports has already regained its pre-recession peak. Partly as a result, Canada’s current account balance has declined from a pre-recession surplus to a deficit of approximately 2 per cent of GDP, which is projected to persist over the forecast horizon (**Chart 31**).

With a somewhat stronger external environment and slightly more momentum in domestic demand, both exports and imports are expected to rise at a somewhat faster pace than anticipated in the *January Report*, although the Bank continues to expect that net exports will contribute little to Canada’s GDP growth over the projection horizon.

Overall, real GDP in Canada is projected to grow at a slightly faster pace than the estimated growth rate of potential output in coming quarters. As a result, the economy is anticipated to gradually return to full capacity by the

Last observation: 2011Q4

Inflation

Core CPI inflation averaged 2.2 per cent over January and February, up slightly from 2.1 per cent in the fourth quarter. As anticipated, the gradual increase from 1.5 per cent in the first half of 2011 partly reflected the lagged effects of higher world prices for agricultural products on the prices of food and clothing, as well as the dissipation of the effect of the introduction of the harmonized sales tax (HST) in Ontario and British Columbia in the third quarter of 2010 on year-over-year core inflation. This upward movement in

core inflation has also been reflected in alternative measures of underlying inflation (Chart 32). Despite higher core inflation, total CPI inflation has declined from its peak of 3.4 per cent in the second quarter of 2011 to an average of 2.6 per cent in January and February. This drop reflects some moderation in gasoline prices from levels seen a year ago, as well as the unwinding of the direct effects of the HST on year-over-year inflation. However, with the rebound in gasoline prices in recent months, total CPI inflation has remained higher than expected in the January Report.

Last observation: February 2012

Inflation expectations remain well anchored. The April Consensus Economics forecasts for total CPI inflation in 2012 and 2013 were 2.1 per cent and 2.0 per cent, respectively. As reported in the Bank's spring *Business Outlook Survey*, over 90 per cent of firms expect average inflation over the next two years to remain within the 1 to 3 per cent inflation-control range. Market-based measures of longer-term inflation expectations also continue to be consistent with the 2 per cent inflation-control target.

◀ *Inflation expectations remain well anchored*

Core inflation is projected to stay close to 2 per cent over the projection horizon (Chart 33), as the economy remains near its production potential, the growth of labour compensation remains moderate (Chart 34) and inflation expectations stay well anchored. The Bank forecasts a slight decline in core inflation in the near term, reflecting the unwinding of the effects of higher prices for food and clothing on year-over-year inflation, as well as lower electricity prices. Core inflation is expected to converge to 2 per cent thereafter as excess supply is fully absorbed. As well, the indirect effects associated with the announced restoration of the provincial sales tax in British Columbia are

Last observations: 2011Q4 and 2012Q1

expected to provide a modest temporary lift to core inflation, beginning in the second quarter of 2013.⁸ Underlying inflation is somewhat firmer than in the January *Report*, owing largely to reduced economic slack.

Total CPI inflation is also projected to decline in the near term to close to 2 per cent, in part reflecting lower core inflation, and to remain around the target over the balance of the projection horizon. The Bank no longer expects total CPI inflation to move significantly below 2 per cent later in 2012. This reflects slightly firmer underlying inflation and, more importantly, the fact that the higher prices for gasoline observed recently (primarily because of higher prices for Brent crude oil, **Box 1**) are expected to be more persistent.

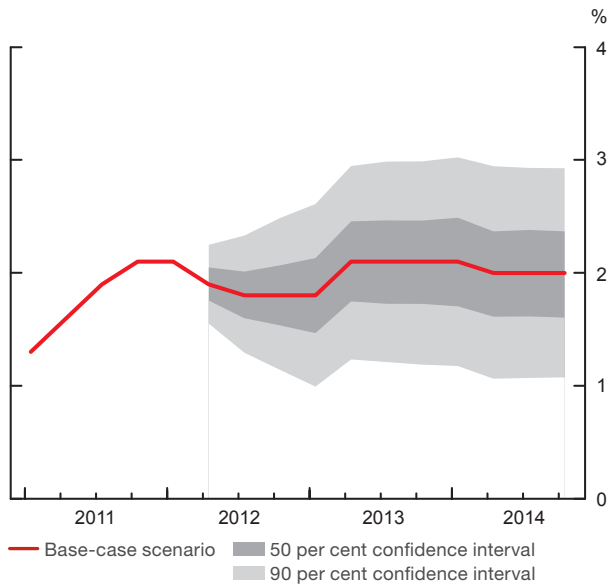

This projection includes a gradual reduction in monetary stimulus over the projection horizon, consistent with achieving the inflation target.

The uncertainty surrounding the Bank's inflation projection is illustrated using fan charts. **Chart 35** and **Chart 36** depict the 50 per cent and 90 per cent confidence bands for year-over-year core inflation and total CPI inflation from the second quarter of 2012 to the end of 2014.

⁸ The province of British Columbia has announced that, in April 2013, it will reverse the July 2010 harmonization of its provincial sales tax with the federal goods and services tax. The section on the projection for inflation in the April 2010 *Monetary Policy Report* provided details on the estimates of the direct impact on total CPI and the indirect impact on core CPI stemming from this tax harmonization. According to the Bank's calculations, announced changes to the HST and other indirect taxes in British Columbia are expected to temporarily increase the year-over-year rate of core inflation by an estimated 0.1 percentage point, and to temporarily reduce the year-over-year rate of total inflation by an estimated 0.1 percentage point, between the second quarter of 2013 and the first quarter of 2014. As in the January base-case scenario, the projection also incorporates the impact of the increase in the Quebec Sales Tax in January 2012, which is estimated to boost total inflation by an estimated 0.1 percentage point in 2012. As with previous changes in indirect taxes, for the purposes of monetary policy, the Bank is looking through the first-round effect of these changes on prices.

Risks to the Outlook

Despite recent improvements to the outlook for the global and Canadian economies, risks remain elevated. Significant steps have been taken to address the sovereign debt and banking crisis in the euro area, reducing the chances of an extreme negative event, but risks in this regard still rest clearly on the downside.

The three main upside risks to inflation in Canada relate to the possibility of higher-than-expected oil prices, stronger-than-expected growth in the U.S. economy and stronger momentum in Canadian household spending.

- Global inflationary pressures could be more persistent than currently projected if oil prices continue to rise and remain above the levels implied by current futures prices.
- Private sector demand in the United States could be stronger than anticipated, and fiscal policy could exert a smaller-than-anticipated drag on growth, if U.S. authorities smooth the path of fiscal consolidation following the November elections.
- Household expenditures in Canada have been stronger than expected and could have more momentum than currently projected.

The two main downside risks to inflation in Canada relate to a reintensification of sovereign debt and banking concerns in Europe, and the possibility that growth in Canadian household spending could be weaker than projected.

- Although policy initiatives to address the sovereign debt and banking crisis in the euro area have resulted in some improvement in European debt markets and global financial conditions, this risk could re-escalate, affecting Canada through financial, confidence and trade channels.
- Continuing high household debt levels in Canada could lead to a sharper-than-expected deceleration in household spending. Relatedly, if there were a sudden weakening in the Canadian housing sector, it could have sizable spillover effects on other areas of the economy.

Overall, the Bank judges that the risks to the inflation outlook in Canada are roughly balanced over the projection period.
