

An early stablecoin?

The Bank of Amsterdam and the governance of money

A rigid stablecoin: the Bank of Amsterdam over 1609-1683

Assets	Liabilities
	Deposits

An impeccable reputation

“At Amsterdam, however, no point of faith is better established than that for every guilder, circulated as bank money, there is a correspondent guilder in gold or silver to be found in the treasure of the bank”

(Adam Smith, *Wealth of Nations*, 1776)

Governance and settlement liquidity

- If stablecoins stick to their governance rules, they provide limited settlement liquidity
- If stablecoins do not stick to their governance rules, that will be problematic in itself (eg, Bank of Amsterdam)

Lessons for the digital era

- Two key lessons for today:
 1. Rigid stablecoins are poorly suited as the foundation for a modern monetary system. If they stick to their governance rules (i.e. full backing), they provide limited settlement or lender of last resort liquidity. If they do not stick to their governance rules, they may be enticed to expand lending over time.
 2. Institutions with a strong reputation can use their room for manoeuvre up to a point, but there may be a breaking point. When the scale of losses is large and fiscal backing is limited, it is possible for an issuer of money to fail.
- While technology changes, the governance of money remains crucial.
- To allow for elastic credit provision and sound fiscal backing, countries around the world have central banks who can issue sovereign fiat currency

Conclusions

- Concept of stablecoins is not new
- The Bank of Amsterdam and bank guilder worked well for a long period of time, but the “halfway house” between a rigid stablecoin and a modern central bank was untenable
- Today’s stablecoins may support important specific use cases, but poorly suited as the foundation for a wholesale payment system
- Just as this historic stablecoin gave way to a modern central bank, could modern stablecoins give way to CBDCs?
- Through the ages, the governance of money is key
